About the Dataset

This dataset was collected as part of an impact evaluation study conducted in Tanzania. The study uses a field experiment approach to assess the effectiveness of farmer-led extension in promoting the adoption of new agricultural technologies, namely, improved bean varieties and a chemical seed treatment (Apron Star). The dataset gives a representative picture of the socio-economic profiles and bean production characteristics of bean producers from 32 villages from two districts in Tanzania that were selected for this evaluation. Three rounds of surveys were conducted, each in 2017 (baseline), 2018 (endline), and 2021 (follow-up). **This document describes the overall study and meta-data for the baseline farmer survey conducted in 2017.**

Description

1. Overview

Agricultural extension is key for accelerating technology transfer and dissemination by providing information and advice to rural smallholders. In the absence of strong public extension services in sub-Saharan Africa (SSA), national governments have turned to public-private partnerships, donors, and non-governmental organizations (NGOs) to demonstrate and promote new agricultural technologies. Many of these programs focus on the identification of lead farmers who are successful early adopters of new agricultural technologies and can share information with others. Lead-farmers are then expected to train other end-user farmers in their local area about the use of new inputs or management practices. Being close in geographic proximity and socio-economic characteristics, lead farmers serve as a conduit for social learning through their own example and can facilitate learning-by-doing by hosting field-days.

Given the potentially high welfare gains from the diffusion of new agricultural technologies, this study investigates the following research question: how do the intensity of non-governmental lead-farmer extension programs influence the farmer adoption of new agricultural technologies among Tanzanian bean producers?

The lead-farmer extension program evaluated in this study was implemented by Farm Input Promotions-Africa (FIPS-Africa). FIPS-Africa is an NGO focused on improving food security and farmer incomes by making improved agricultural inputs and practices accessible to small-scale farmers. Using a network of Village-Based Agricultural Advisors (VBAAAs), FIPS-Africa provides

extension services through technology demonstration plots (where new technologies are showcased alongside traditional ones) and the distribution of free small trial packs of improved inputs to end-user farmers for them to test on their own plots. VBAs operate in their local community and are selected by their fellow community members based on farming experience, record keeping and communication skills, willingness to follow up with FIPS-Africa, and interest in becoming an agricultural input supplier. VBAs are all volunteers and are not paid employees of FIPS-Africa or other collaborating partners. Each VBA serves as the primary point of contact between his/her village and external public and private research institutes and firms that are interested in piloting or marketing new agricultural technologies. The intensity of extension program is measured in terms of level of participation of farmers and information/experience they receive from the VBAs. Below we describe the experiment and sample design underlying the dataset.

2. Experiment design

The study builds on an existing program in the southern highlands of Tanzania to assess the effect of two randomly assigned lead-farmer extension treatments that differ in intensity (Melkani and Mason 2018). The first is a demonstration plot approach, where a lead-farmer maintains a plot in the village (referred as ‘mother demo plot’) to educate other farmers about the use and benefits of improved bean inputs (seed for three improved bean varieties and a new chemical bean seed treatment product). In the second more intensive approach, the lead-farmer maintains a demonstration plot and also distributes trial packs (referred as ‘baby demo plots’) of the improved bean inputs to village farmers to test the new technologies on their own land.

3. Technologies promoted by the lead-farmer extension model

The extension program in the study area focused on promoting three improved bean varieties (Uyole 96, Njano Uyole, and Uyole 03) and the chemical seed treatment (Apron Star) to farmers in the study area.

4. Study area and sample design

The impact evaluation study focuses on two districts – Mbozi and Mbeya Rural. A total of 32 villages were included in the final sample with 16 from each treatment group. These villages were equally spread across two administrative districts – Mbeya Rural and Mbozi (Table 1).

Within each village, we randomly selected 25 bean growing households to participate in a bean production survey. Each village maintains a roster of current households and their members residing in the village. Upon arrival in the village, we met with the village chairperson, members of the village council, and, when available, the local agricultural extension agent and/or VBA to ensure we had a complete and correct roster of current village households. From the list of current households, we then worked with village leadership to identify all of the bean growing households in the village based on recorded agricultural production from the previous year. We then rolled a six-sided die to determine the random start point for sampling of the bean growing households. We calculated the sampling interval by dividing the total number of bean growing households in

the village by 25, the number that we wanted to interview. In each village we also selected an additional 10 households using the same process to serve as replacement households in the event that a selected household was not available or declined to participate in the study.

Table 1: Lead-farmer extension treatments in Mbeya Rural and Mbozi districts and sample selection

Treatment Arm	Treatment (VBAA activities)	Total villages in RCT	Sample for Impact Evaluation	
			Number of villages selected for impact evaluation	Number of farm households selected for survey
T1: Demonstration plot (DP)	Provide a 200m ² demonstration plot showcasing traditional and local varieties of untreated and treated bean seed. This occurred Major season (March-July) 2017.	15 in Mbozi and 12 in Mbeya	8 each in Mbeya Rural and Mbozi (randomly selected)	25 HHs/village (selected randomly from a list of all bean growing HHs)
T2: Demonstration plot with trial packs (DPTP)	Provide the same demonstration plot in T1 plus distribute 150 small trial packs of bean seed containing 100g sachets of improved and local varieties of bean seed both treated and untreated. This occurred Major season (March-July) 2017.	14 in Mbozi and 15 in Mbeya	8 each in Mbeya Rural and Mbozi (randomly selected)	25 HHs/village (selected randomly from a list of all bean growing HHs)

5. Data collection

Three rounds of data collection have been completed. This dataset includes data from Round 1 or the baseline survey, which was conducted in August-September 2017. In the baseline survey, an additional research component was implemented to assess farmers' willingness to pay for improved bean varieties and Apron Star seed treatment using the Becker, DeGroot, Marschack (BDM) auction experiments. For this component, we worked with Farm Input Promotions – Africa (FIPS-Africa) to choose 6 control villages, who met all the criteria for participation in the lead-farmer extension program but were excluded due to external constraints. Within each village, 25 bean-growing households were randomly selected from village rosters to participate in a household survey covering bean production history, engagement with lead-farmer extension activities, knowledge of new agricultural technologies, and household demographics. In a sub-set of 12 villages from the T1 and T2 groups and the additional 6 control villages, auction experiments were also conducted to assess farmers' willingness to pay for improved seeds and seed treatment. The baseline dataset includes valid observations from 938 farmers—791 from the RCT villages and 147 from the control villages.

The endline survey was conducted in September 2018 in the 32 villages that were part of the original RCT. This corresponded to one year after the two treatment interventions were implemented in the 32 villages. The same farmers from the baseline survey were included in this follow up survey. Additional modules on social networks, personality traits, and risk experiments were included in the 2018 survey (for both the farmers and the VBAs). The GPS coordinates of each surveyed household and the demonstration plots (which are excluded from the published dataset to maintain data confidentiality and privacy) were also recorded in the 2018 survey. The endline dataset includes valid observations from 740 farmers and 32 VBAs. This dataset is reported separately.

A short follow-up survey was conducted in June 24-September 7, 2021 to track the long-term adoption of promoted technologies in the study area. All the households from the baseline sample were approached for this survey. We were able to reach a total of 704 farmers from T1 and T2 villages. This round also includes data from the VBAs in each village. Two VBAs originally in the sample were not able to be contacted. So this dataset includes data for 30 VBAs. This dataset is reported separately.

All data collection in all the rounds was done using tablets. The survey was programmed using SurveyCTO.

Dataset Overview

Type	Edited, anonymous dataset for public distribution
Identification	N/A
Version	v01
Kind of Data	Sample survey data [ssd]
Unit of Analysis	Households and farm plots
Language	Survey was implemented verbally in Kiswahili
Questionnaires	Available in English

Scope & Coverage

Time Period(s)	2017
Countries	Tanzania
Regional coverage:	Two districts in southern highland region—Mbozi and Mbeya Rural

Producers & Sponsors

Primary Investigator(s): Mywish K. Maredia and Nicole Mason-Wardell, Michigan State University

Funding Agency/ies: This work was undertaken as part of, and funded by, the CGIAR Research Program on Policies, Institutions, and Markets (PIM) led by the International Food Policy Research Institute (IFPRI)

Data Collection Dates

start 2017-08-21; end 2017-09-17

Citation Requirements

Use of the dataset must be acknowledged using a citation which would include:

- the Identification of the Primary Investigator
- the title of the survey (including country, acronym and year of implementation)
- the survey reference number
- the source and date of download

Anonymization notes

Following variables in the datasets are excluded as part of anonymization: names of supervisors, enumerators, respondents, head of the household, spouse, and VBAs; name of the village, phone numbers, and GPS coordinates.

mn16p17a: What quantity of labor was used on plot #\${mn16plot}?

Information	[Type= continuous] [Format=numeric] [Range= 1-100] [Missing=*]
Statistics [NW/ W]	[Valid=488 /-] [Invalid=0 /-] [Mean=20.744 /-] [StdDev=16.052 /-]
Notes	"What quantity of labor was used on plot #?"

mn16p17b: Units- labour

Information	[Type= discrete] [Format=numeric] [Range= 1-2] [Missing=*]
Statistics [NW/ W]	[Valid=488 /-] [Invalid=0 /-]
Notes	"Units- labour"

Value	Label	Cases	Percentage
1	mandays	484	99.2%
2	hours	4	0.8%

Warning: these figures indicate the number of cases found in the data file. They cannot be interpreted as summary statistics of the population of interest.

File : baseline_Table_2_7_2-3_plot_minor_2015-16_anonymized_

mn16p18: What was the estimated cost of hired labor on plot # \${mn16plot} (Tsh)?

Information [Type= continuous] [Format=numeric] [Range= -9-532000] [Missing=*]

Statistics [NW/ W] [Valid=488 /-] [Invalid=0 /-] [Mean=19473.414 /-] [StdDev=50418.04 /-]

Notes "What was the estimated cost of hired labor on plot # (Tsh)?"
